

Sprint One Review

Duration of Sprint 1 - (16th April - 6 May)

Group Members:

- Izaac Crooke - (Project Member)
- Hayden Woodhead - (Project Leader)
- Dominic Porter - (Project Member)

During this sprint we hoped to completed the following tasks:

- Create Django Models
- Url Routes
- Stub Views

Over the past few weeks we have completed lots of planning around the database side of the project. We established some basic api docs on the tessera github wiki, this is beneficial for the developers as they can view endpoints, also because during our last assignment this was very helpful for our front end developers.

During this sprint we also had a two week break, during this period of time not much work got done on the project, due to the fact alot of our group members were burnt out from the workload they had been under.

We have had a few problems with attendance, but this was quickly resolved through a written warning and a group chat.

Team work has also been strong and when group meetings are in place, the team works together and gets through the required goals and tasks for that specific meeting. This was demonstrated while we were creating our url routes which only took a after noon to completed about 85% of them. During this time we also updated the api docs regarding the url routes.

Overall this sprint was successful, as we completed all our goals for this sprint and inside the required time frame. During the next sprint we hope to solve our attendance problems and keep the team work going as we are currently on track and a little bit ahead of schedule.
